Name of Title: Guest Room Customisation Portal

1. Abstract:

The Guest Room Customisation Portal is a user-friendly web application created to make hotel stays more comfortable and personalized for guests. Nowadays, people expect more than just booking a room—they want an experience that matches their preferences and needs. This portal helps hotels provide that experience by allowing guests to customize their room and services easily before they arrive or during their stay.

Using this system, guests can choose their preferred room type, bed style, room temperature, lighting, and even extra amenities like Wi-Fi packages, snacks, or toiletries. They can also request additional services such as extra pillows, room decorations for birthdays or anniversaries, early check-in, late check-out, or specific housekeeping times. By giving guests the freedom to set their preferences in advance, hotels can prepare everything ahead of time and offer better service.

The portal also includes separate access for hotel staff and administrators. Guests can create an account, book rooms, and update their preferences anytime. On the other hand, hotel staff can view customer requests, manage room availability, and respond quickly to service needs. This reduces misunderstandings and saves time for both guests and hotel employees.

This project can be developed using technologies like HTML, CSS, JavaScript, and backend tools such as PHP, Python, or Node.js, along with a database like MySQL. The main goal of this project is to improve customer satisfaction, make hotel operations smoother, and reduce the need for repeated communication.

Overall, the Guest Room Customisation Portal is a practical and modern solution that combines technology with hospitality, making hotel stays easier, more enjoyable, and more personalized for every guest.
